

CRISP Encounter Notification Service (ENS) PROMPT Tip Sheet: Filtering for Nonfatal Overdoses

PROMPT Filter Purpose: To identify patients in your practice that have had a nonfatal overdose and were treated by Emergency Medical Services (EMS) or treated at a hospital emergency department. PROMPT displays nonfatal overdoses in your standard ENS feed, but this filter allows you to focus on this population.

What is a Smart Alert? A CRISP Smart Alert is a special filter within PROMPT that uses logic to find and limit the encounter notification list for a particular purpose. This tip sheet will help you filter within ENS PROMPT to identify patients that are either treated by EMS or visit the emergency room for nonfatal overdoses.

How can I filter for nonfatal overdoses? Follow the steps below to filter to nonfatal overdose events. Please note that the criteria to identify overdose events for EMS-based alerts differs from that of hospital-based alerts. You can always review a patient's full Health Record for more information. Additionally, full EMS incident reports are available as MD Ambulance PDF Reports within the Clinical Note section of Health Records. **Note:** After completing your overdose alert review, be sure to remove the filter to ensure all ENS PROMPT notifications are visible the next time you log in.

1. Log in to the CRISP Portal and select 'ENS PROMPT.'

2. Select your Panel and navigate to the Filters. Select “Alert Type Contains Overdose.” Save this filter as “Overdose Alerts.”

A. Select and save your filter.

4. Contact patients identified on these lists and conduct follow-up.
5. **Once your review is complete, don't forget to remove the filter** so that you will see all notifications for your ENS panel the next time you log in.

6. **To exclude overdose alerts from your view**, select “Alert Type Does Not Contain Overdose.” Once complete, save the filter, then apply it. You will now be able to apply this filter any time you are in PROMPT. An example of the filter can be seen below.

A. Select and save the filter.

7. Due to how alerts display in PROMPT and our inability to display full incident details, the reasoning for an EMS-based overdose alert may not be immediately clear. **EMS incident reports, called MD Ambulance PDF Reports, are available in Health Records within the Clinical Information section of patient records, as shown below.** You can access the report to review full incident details.

Please provide feedback to CRISP on the accuracy and usefulness of these alerts. Your feedback may be useful for process improvements in timeliness and reliability of alerts.
